

Social Media & Text Analysis

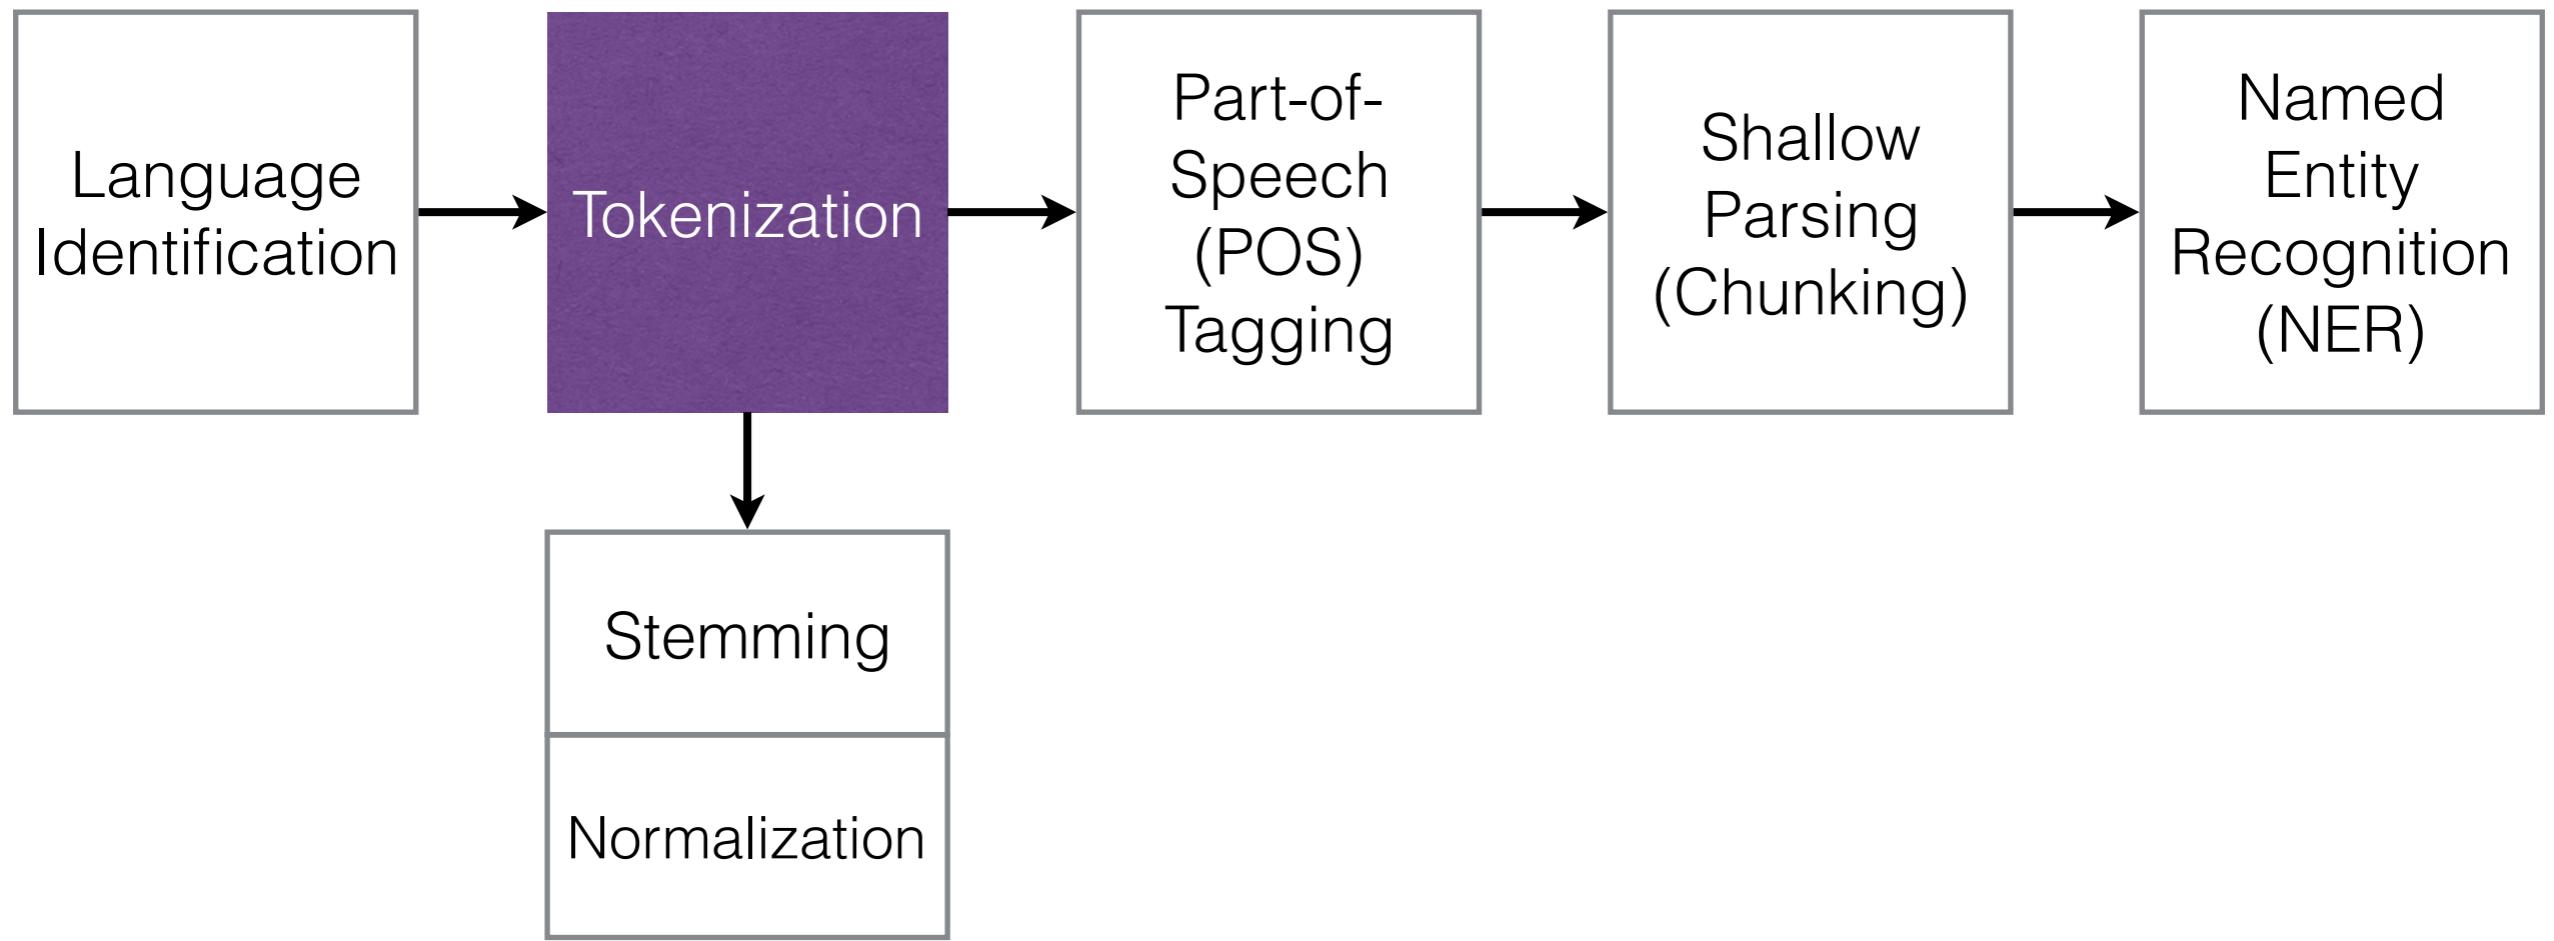

lecture 7 - Twitter NLP Pipeline

Tokenization, Normalization, POS/NE Tagging

CSE 5539-0010 Ohio State University
Instructor: Wei Xu
Website: socialmedia-class.org

NLP Pipeline

Tokenization

- breaks up the string into words and punctuation
- need to handle:
 - abbreviations (“jr.”), number (“5,000”) ...

```
seas479:training weixu$ ./penn-treebank-tokenizer.perl  
Tokenizer v3  
Language: en
```

```
Ms. Hilton last year called Mr. Rothschild "the love of my life."  
Ms. Hilton last year called Mr. Rothschild " the love of my life . "
```

← input

← output

Tokenization

- for Twitter, additionally need to handle:
 - emoticons, urls, #hashtags, @mentions ...

```
>>> import twokenize
>>> input = "Clowns are pretty gross tho O.o (I'm afraid of clow
ns :p) ask.fm/a/cc301167"
>>> twokenize.tokenizeRawTweetText(input)
['Clowns', 'are', 'pretty', 'gross', 'tho', 'O.o', '(', "I'm",
 'afraid', 'of', 'clowns', ':p', ')', 'ask.fm/a/cc301167']
```

The diagram illustrates the tokenization process. A red arrow points from the word "input" to the original tweet text, indicating the source of the data. A blue arrow points from the word "output" to the resulting list of tokens, indicating the result of the tokenization function.

Tool: twokenize.py

```
3 Twokenize -- a tokenizer designed for Twitter text in English and some other European languages.  
4 This tokenizer code has gone through a long history:  
5  
6 (1) Brendan O'Connor wrote original version in Python, http://github.com/brendano/tweetmotif  
7 TweetMotif: Exploratory Search and Topic Summarization for Twitter.  
8 Brendan O'Connor, Michel Krieger, and David Ahn.  
9 ICWSM-2010 (demo track), http://renocon.com/oconnor\_krieger\_ahn.icwsm2010.tweetmotif.pdf  
10 (2a) Kevin Gimpel and Daniel Mills modified it for POS tagging for the CMU ARK Twitter POS Tagger  
11 (2b) Jason Baldridge and David Snyder ported it to Scala  
12 (3) Brendan bugfixed the Scala port and merged with POS-specific changes  
13 for the CMU ARK Twitter POS Tagger  
14 (4) Tobi Owoputi ported it back to Java and added many improvements (2012-06)  
15  
16 Current home is http://github.com/brendano/ark-tweet-nlp and http://www.ark.cs.cmu.edu/TweetNLP
```

Tokenization

- main techniques:
 - hand-crafted rules as regular expressions

Regular Expression

- a pattern matching language
- invented by American Mathematician Stephen Kleene in the 1950s
- used for search, find, replace, validation ... (very frequently used when dealing with strings)
- supported by most programming languages
- easy to learn, but hard to master

Regular Expression

147

Hashtag = "#[a-zA-Z0-9_]+"

- [] indicates a set of characters:
 - [amk] will match ‘a’, ‘m’, or ‘k’
 - [a-z] will match any lowercase letter
('abcdefghijklmnopqrstuvwxyz')
 - [a-zA-Z0-9_] will match any letter or digit or ‘_’
- + matches 1 or more repetitions of preceding RE

Regular Expression

147

Hashtag = "#[a-zA-Z0-9_]+"

- will match strings that:
 - start with a '#'
 - follow with one or more letters/digits/‘_’

Regular Expression

147

Hashtag = "#[a-zA-Z0-9_]+"

```
>>> import re
>>> Hashtag = "#[a-zA-Z0-9_]+"
>>> hashtagpattern = re.compile(Hashtag)
>>> hashtagpattern.findall("So that's what #StarWars")
['#StarWars']
```

Regular Expression

133

Hearts = "(?:<+/?3+)+"

- will match strings that:
 - start with one or more '<'
 - then maybe a '/'
 - then one or more '3'
 - and maybe repetitions of the above

Regular Expression

133

Hearts = "(?:<+/?3+)+"

- ‘+’ matches 1 or more repetitions of the preceding RE
 - ‘<+’ matches ‘<’, ‘<<’, ‘<<<’ ...
 - ‘3+’ matches ‘3’, ‘33’, ‘333’ ...
- ‘?’ matches 0 or 1 repetitions of the preceding RE
 - ‘/?’ matches ‘/’ or nothing (so handles ‘</3’)
- (?: ...) is a non-capturing version of (...)
- (...) matches whatever RE is inside the parentheses

Regular Expression

133

Hearts = "(?:<+/?3+)+"

```
>>> import re
>>> Hearts = "(?:<+/?3+)+" 
>>> heartspattern = re.compile(Hearts)
>>> heartspattern.findall("I <3 u <3<333333")
['<3', '<3<333333']
>>> heartspattern.findall("sooo sad </3")
['</3']
```

Regular Expression

133

Hearts = "(?:<+/?3+)+"

```
Python 2.7.10 (default, Feb  7 2017, 00:08:15)
[GCC 4.2.1 Compatible Apple LLVM 8.0.0 (clang-800.0.34)] on darwin
Type "help", "copyright", "credits" or "license" for more information.
[>>> import re
[>>> heart1 = "<+/?3+)+"
[>>> heartpattern1 = re.compile(heart1)
[>>> heartpattern1.findall("I <3 u <3<333")
['<3', '<333']
[>>>
[>>> heart2 = "(?:<+/?3+)+"
[>>> heartpattern2 = re.compile(heart2)
[>>> heartpattern2.findall("I <3 u <3<333")
['<3', '<3<333']
[>>>
[>>> ]
```

 - 7.2.5.7. Finding all Adverbs and their Positions
 - 7.2.5.8. Raw String Notation

7.2. `re` — Regular expression operations

This module provides regular expression matching operations similar to those found in Perl. Both patterns and strings to be searched can be Unicode strings as well as 8-bit strings.

Regular expressions use the backslash character (`\`) to indicate special forms or to allow special characters to be used without invoking their special meaning. This collides with Python's usage of the same character for the same purpose in string literals; for example, to match a literal backslash, one might have to write `\\\\\\` as the pattern string, because the regular expression must be `\`, and each backslash must be expressed as `\` inside a regular Python string literal.

The solution is to use Python's raw string notation for regular expression patterns; backslashes are not handled in any special way in a string literal prefixed with `r"`. So `r"\n"` is a two-character string containing `\n` and `\n`, while `"\n"` is a one-character string containing a newline. Usually patterns will be expressed in Python code using this raw string notation.

It is important to note that most regular expression operations are available as module-level functions and `RegexObject` methods. The functions are shortcuts that don't require you to compile a regex object first, but miss some fine-tuning parameters.

7.2.1. Regular Expression Syntax

Tokenization

- for Twitter, additionally need to handle:
 - emoticons, urls, #hashtags, @mentions ...

```
>>> import twokenize
>>> input = "Clowns are pretty gross tho O.o (I'm afraid of clow
ns :p) ask.fm/a/cc301167"
>>> twokenize.tokenizeRawTweetText(input)
['Clowns', 'are', 'pretty', 'gross', 'tho', 'O.o', '(', "I'm",
 'afraid', 'of', 'clowns', ':p', ')', 'ask.fm/a/cc301167']
```

The diagram illustrates the process of tokenization. A red arrow points from the word "input" to the variable "input" in the code, indicating the source text. A blue arrow points from the word "output" to the list of tokens returned by the function, indicating the resulting list of words.

Emoticons

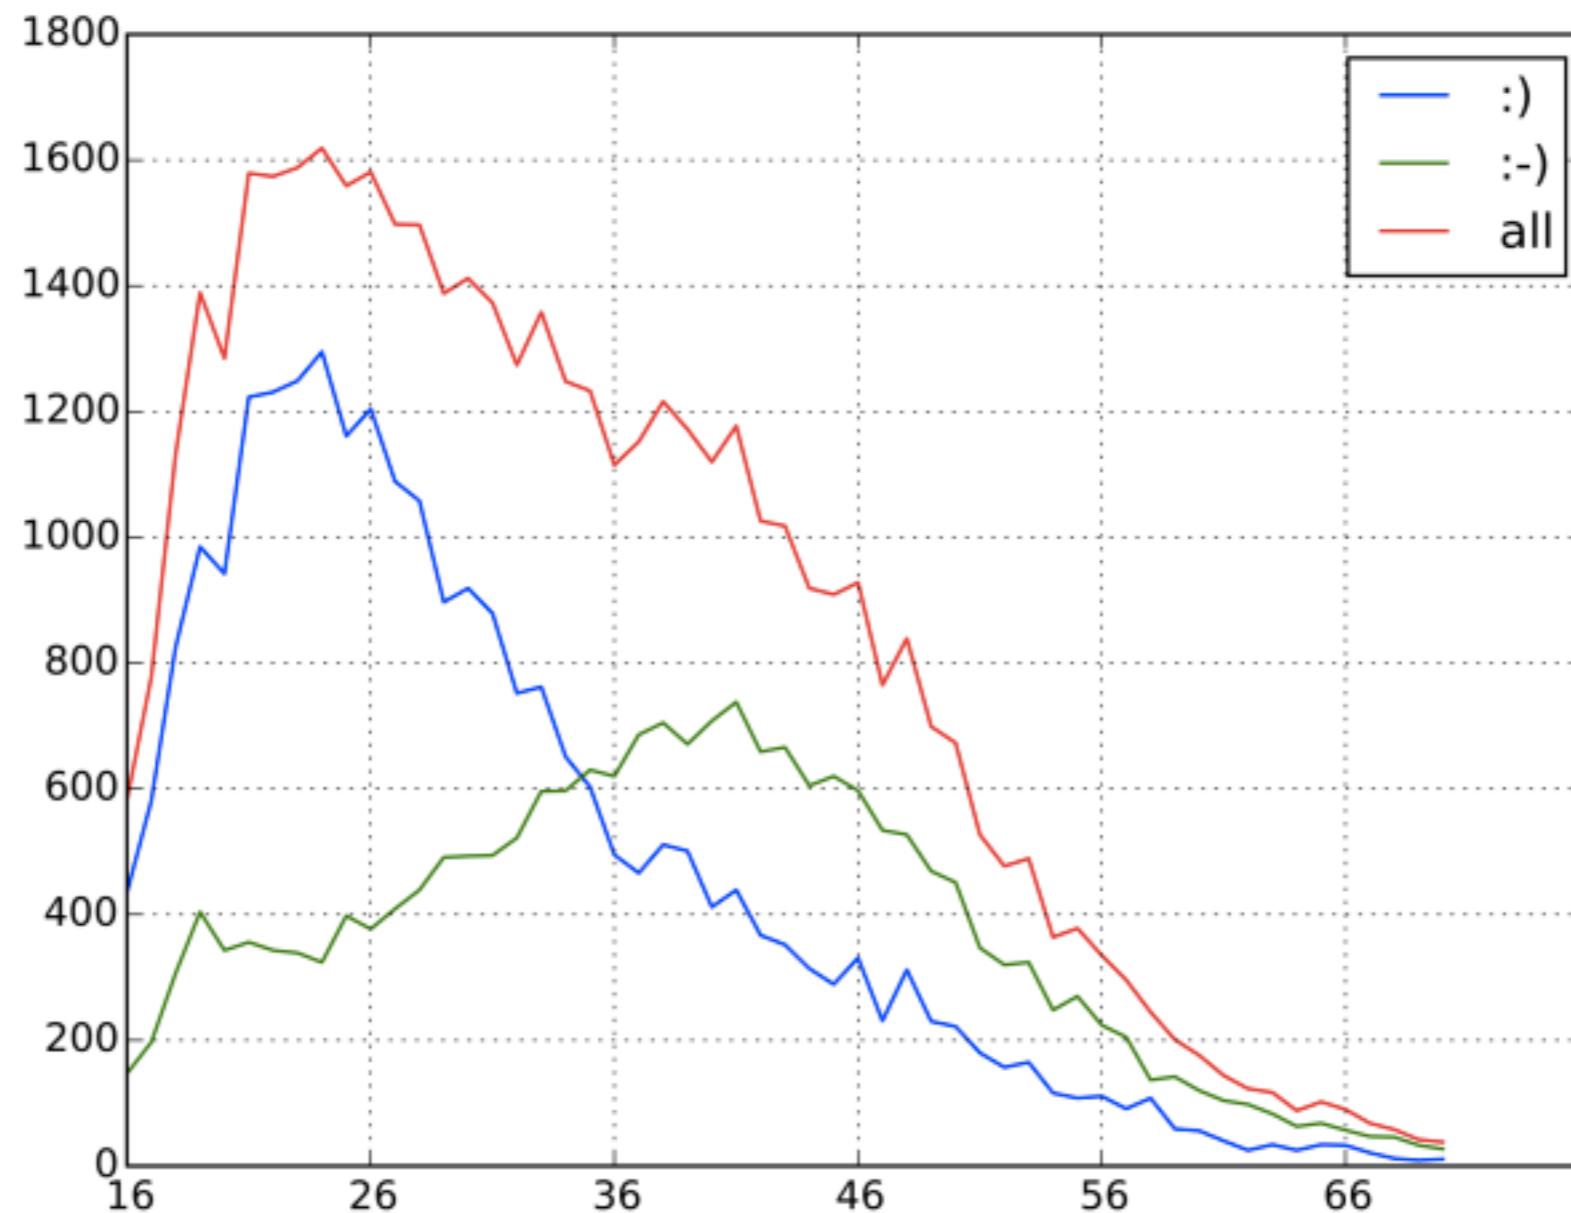

Figure 3: Usage of emoticons with and without nose by age group, aggregated over all countries

Dirk Hovy, Anders Johannsen, and Anders Søgaard.
User review sites as a resource for large-scale sociolinguistic studies. WWW, 2015

Emoticons

With respect to gender, we find that women tend to use the noseless variant significantly more than men, except for France, where the difference between genders is not statistically significant at the chosen level.

country	AGE		GENDER significant
	Spearman ρ	significant	
Denmark	0.89	yes	yes
France	0.63	yes	no
Germany	0.83	yes	yes
UK	0.83	yes	yes
US	0.82	yes	yes

Tokenization

- language dependent

下雨天留客天留我不留

Unpunctuated Chinese sentence

下雨、天留客。天留、我不留！

It is raining, the god would like the guest to stay. Although the god wants you to stay, I do not!

下雨天、留客天。留我不？留！

The rainy day, the staying day. Would you like me to stay? Sure!

我喜欢新西兰花

Unsegmented Chinese sentence

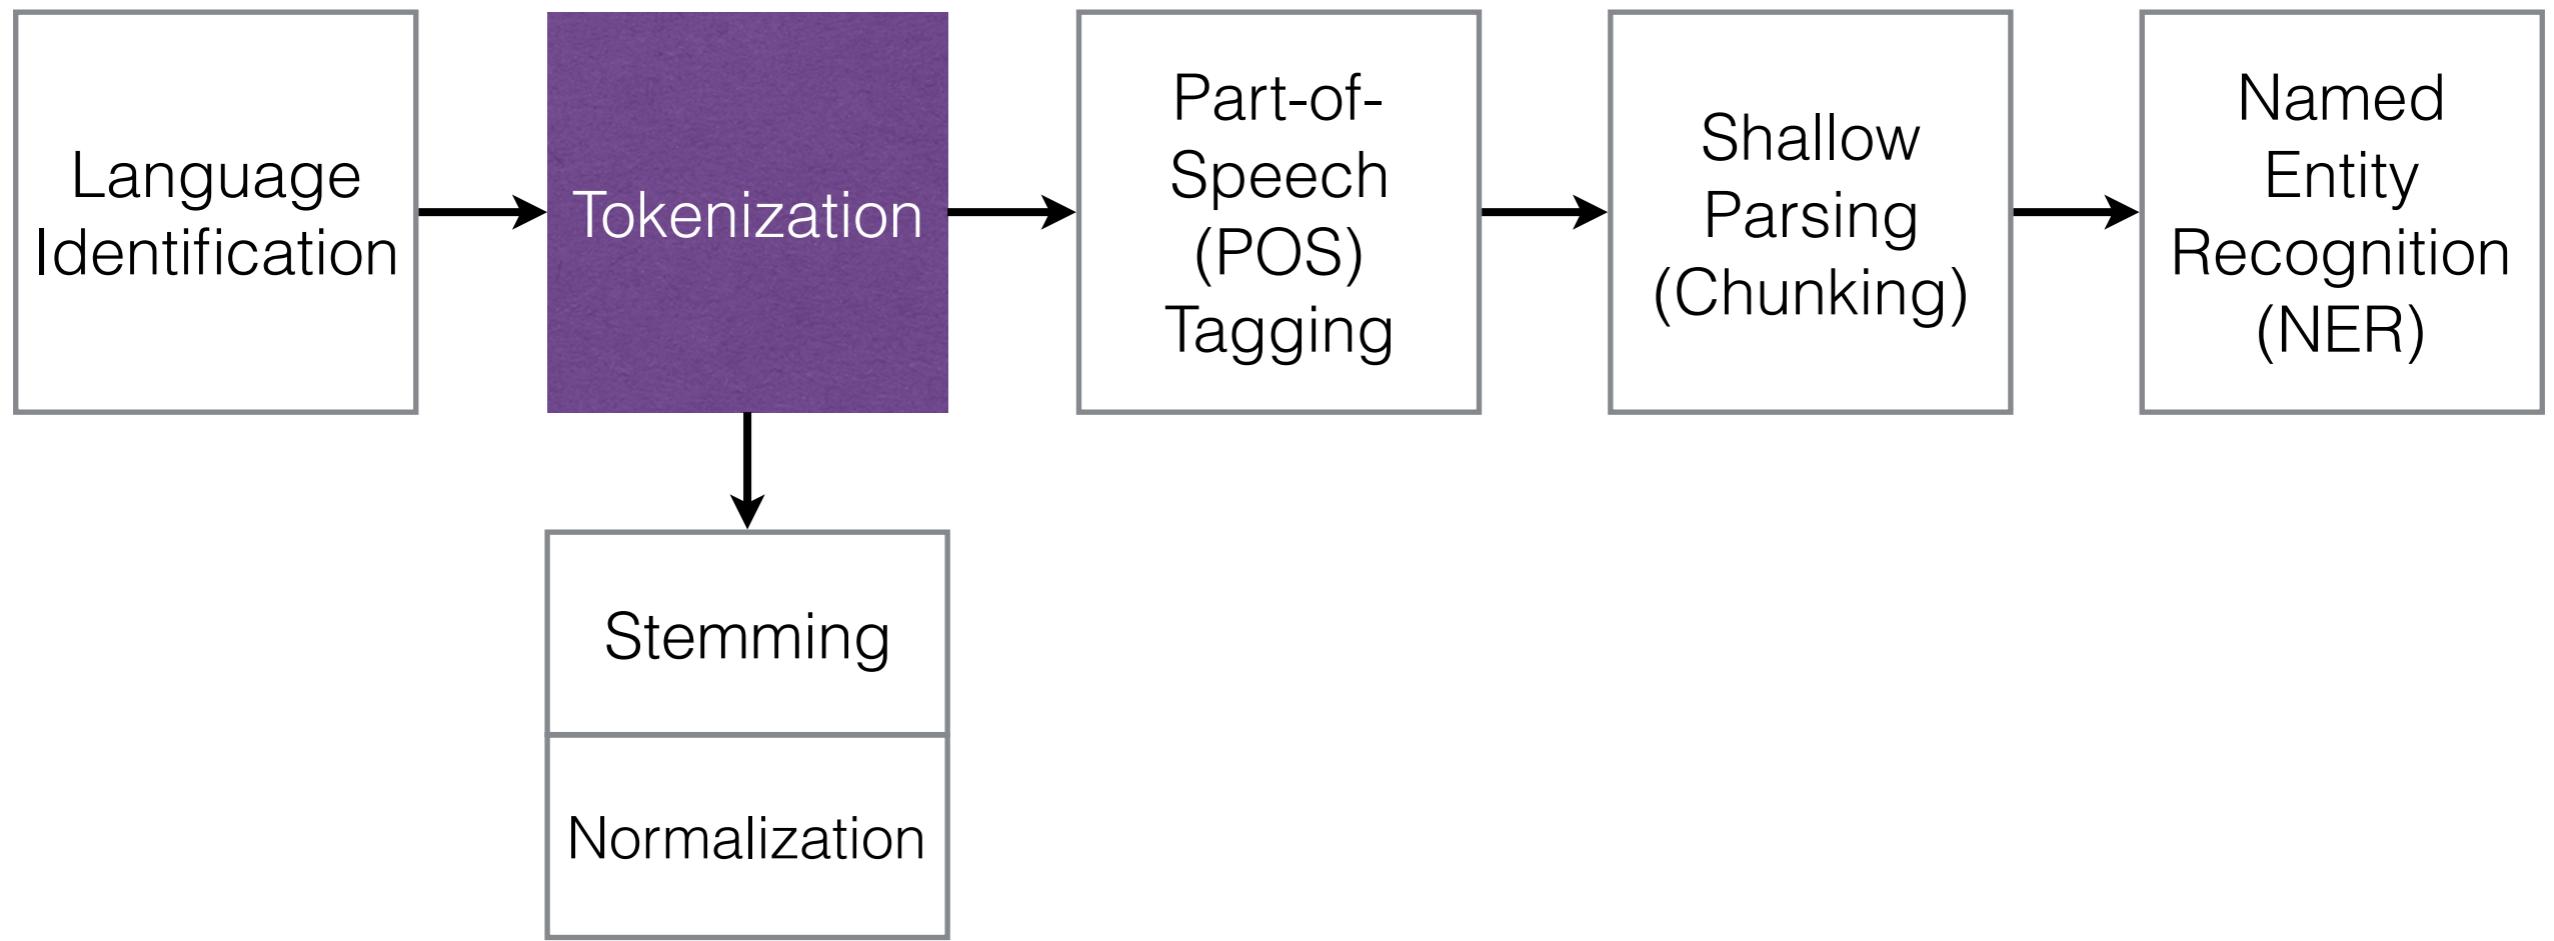

我 喜欢 新西兰 花

I like New Zealand flowers

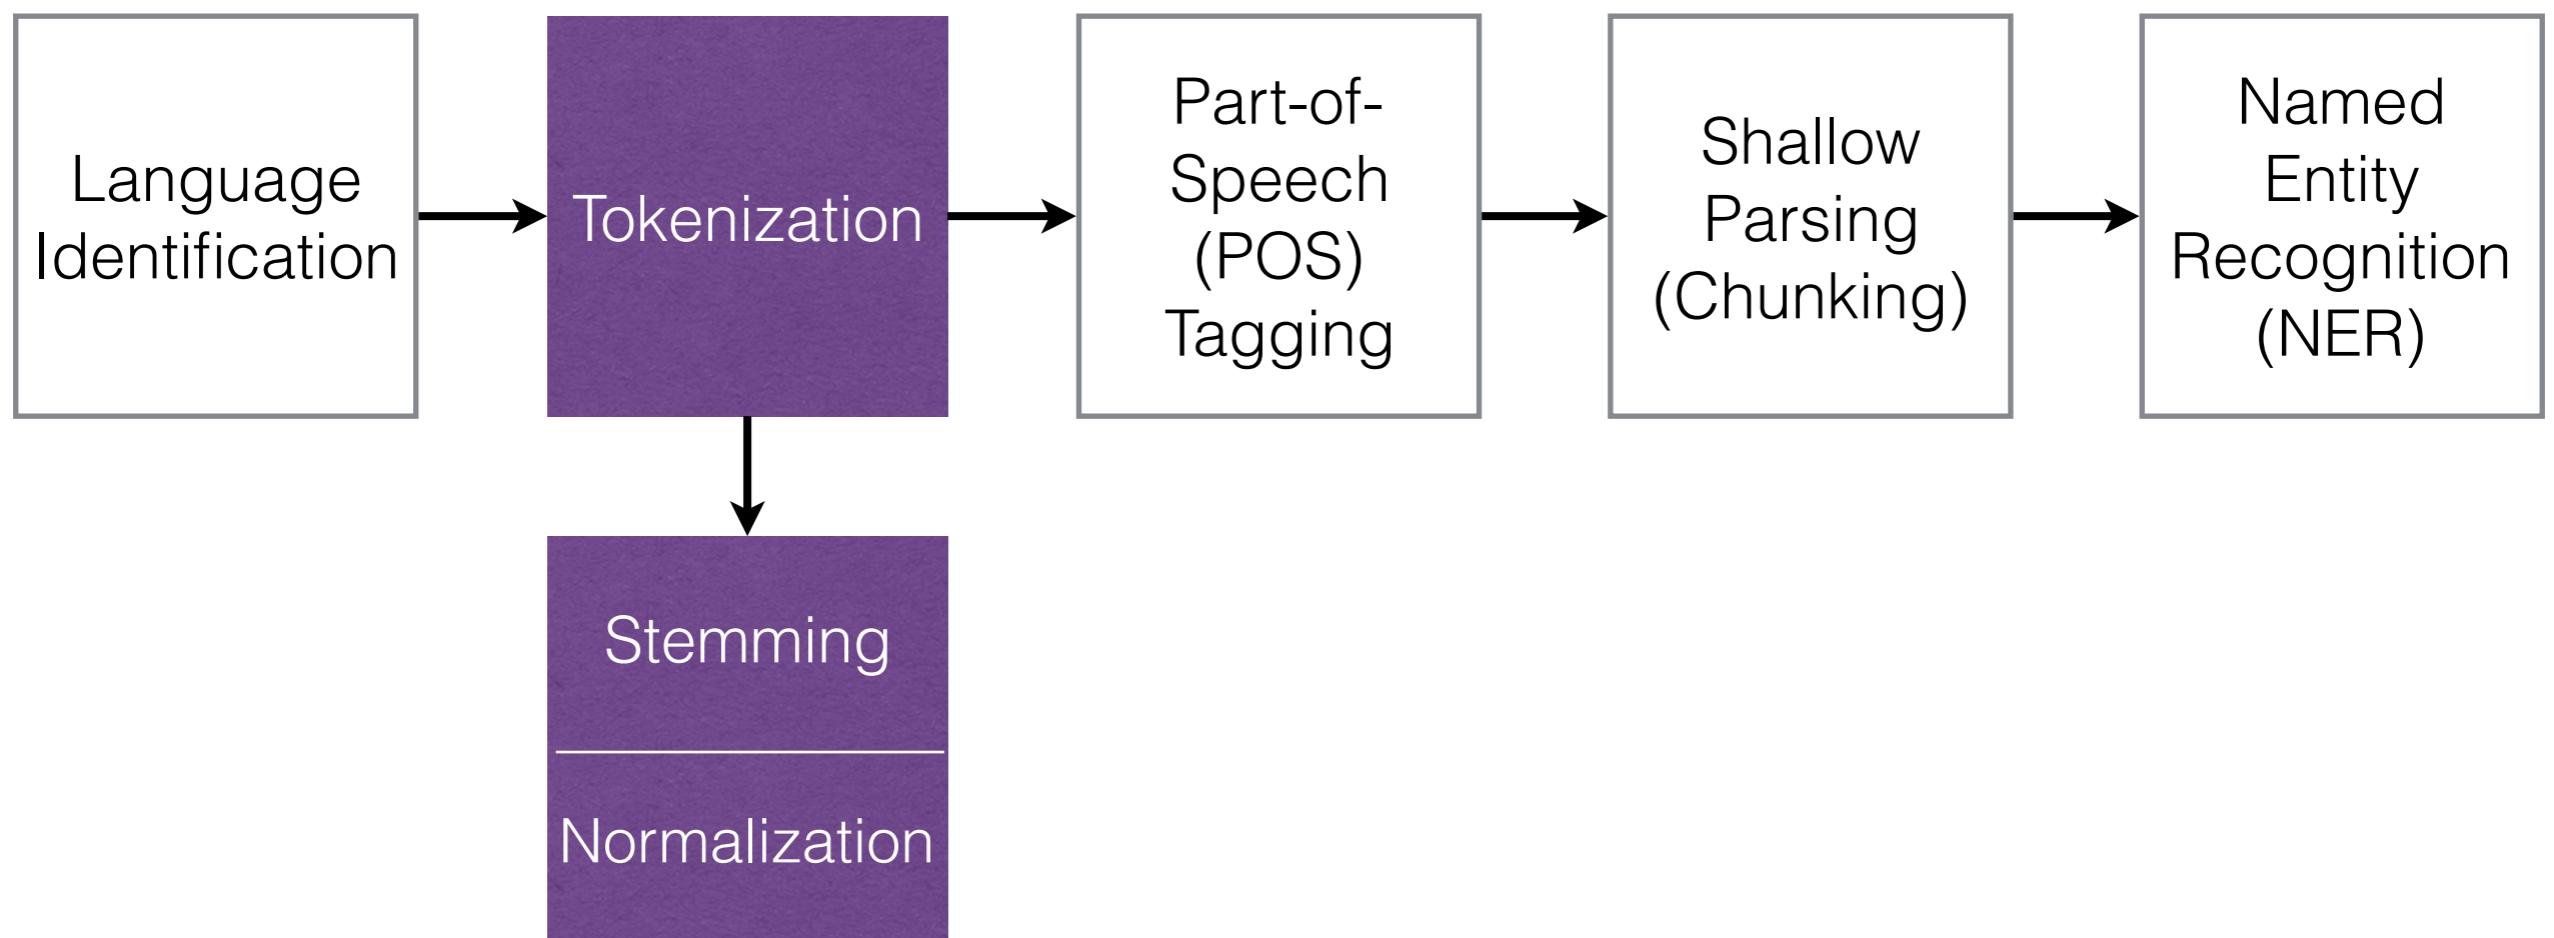

我 喜欢 新 西兰花

I like fresh broccoli

NLP Pipeline

NLP Pipeline

Stemming

- reduce inflected words to their word stem, base or root form (not necessarily the morphological root)
- studied since the 1960s

```
>>> from nltk.stem.porter import PorterStemmer  
>>> stemmer = PorterStemmer()  
>>> stemmer.stem('automate')  
'autom'  
>>> stemmer.stem('automates')  
'autom'  
>>> stemmer.stem('automation')  
'autom'
```

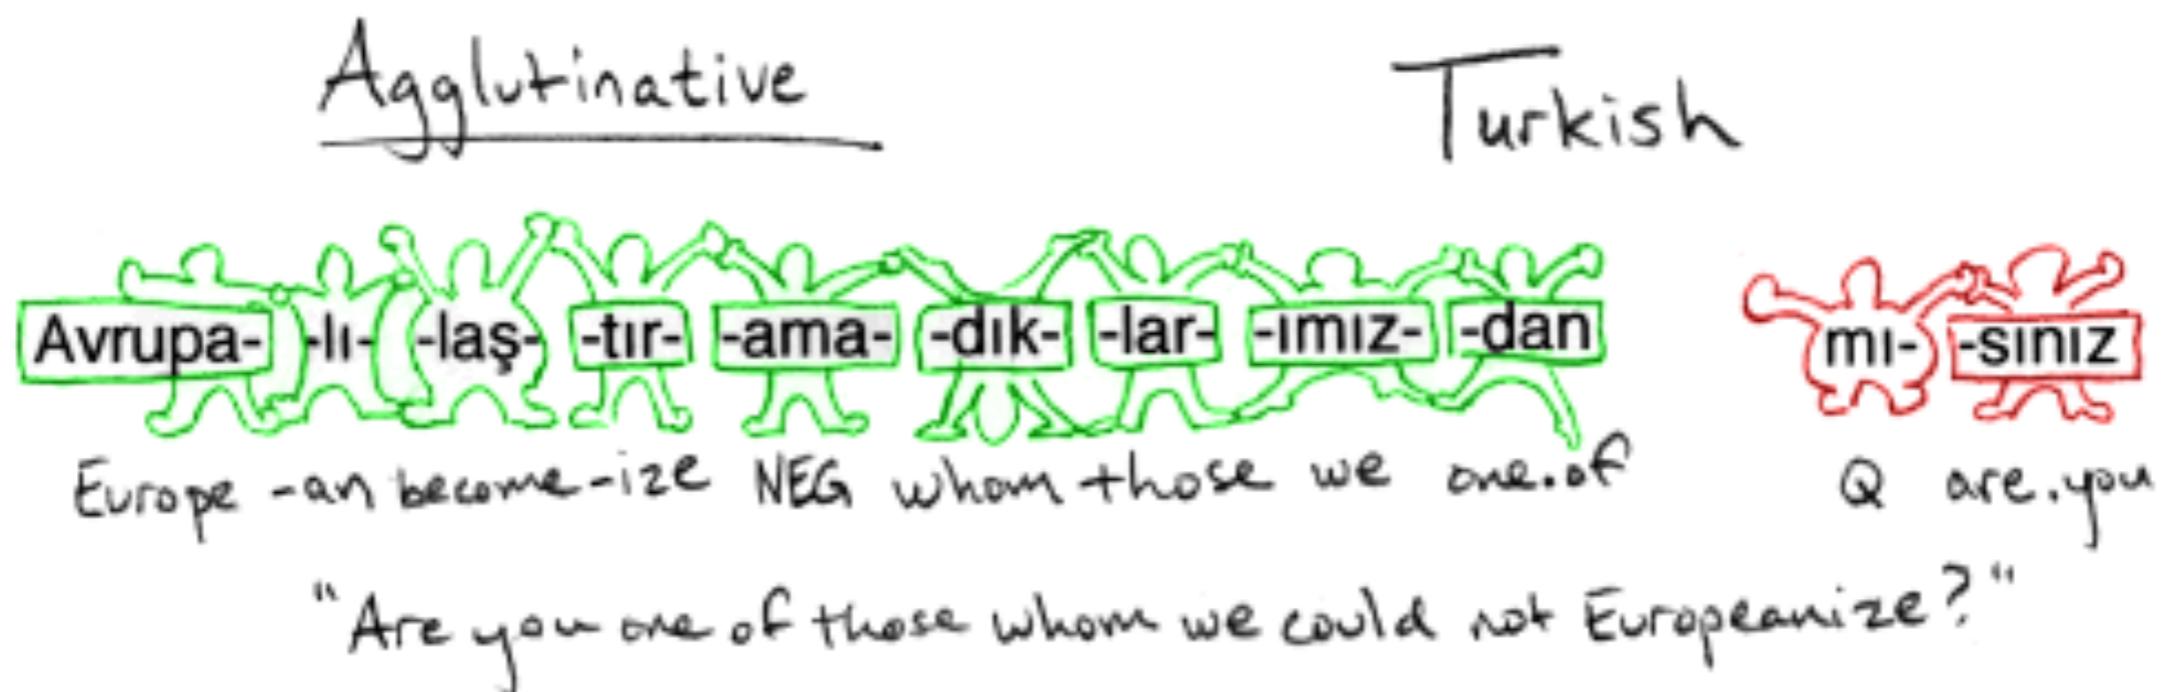

Stemming

- different stemmers: Porter, Snowball, Lancaster ...
- WordNet's built-in lemmatized (dictionary-based)

```
>>> from nltk.stem import WordNetLemmatizer  
>>> wordnet_lemmatizer = WordNetLemmatizer()  
>>> wordnet_lemmatizer.lemmatize('leaves', pos='n')  
'leaf'  
>>> wordnet_lemmatizer.lemmatize('leaves', pos='v')  
'leave'
```

Stemming

- language dependent

Text Normalization

- convert non-standard words to standard

Original tweet
@USER, r u cuming 2 MidCorner dis Sunday?

Normalized tweet
@USER, are you coming to MidCorner this Sunday?

Original tweet
Still have to get up early 2mr thou 😞 so Gn 😴

Normalized tweet
Still have to get up early tomorrow though 😞 so Good night 😴

Source: Tim Baldwin, Marie de Marneffe, Han Bo, Young-Bum Kim, Alan Ritter, Wei Xu
Shared Tasks of the 2015 Workshop on Noisy User-generated Text:
Twitter Lexical Normalization and Named Entity Recognition

Text Normalization

- types of non-standard words in 449 English tweets:

Category	Ratio	Example
letter&numer	2.36%	b4 → before
letter	72.44%	shuld → should
number substitution	2.76%	4 → for
slang	12.20	lol → laugh out loud
other	10.24%	sucha → such a

most non-standard words are morphophonemic “errors”

Source: Bo Han and Timothy Baldwin

“Lexical normalisation of short text messages: Makn sens a #twitter” ACL 2011

A Normalization Lexicon

- automatically derived from Twitter data + dictionary

41169	costumess	costumes
41170	nywhere	anywhere
41171	sandwhich	sandwich
41172	aleksander	alexander
41173	juns	jun
41174	showi	showing
41175	washingq	washing
41176	jscript	script
41177	fundin	funding
41178	itxted	fitted
41179	cheeeap	cheap
41180	fawesome	awesome
41181	untalented	talented
41182		

Performance

Precision = 0.847
Recall = 0.630
F1-Score = 0.723

Source: Bo Han, Paul Cook and Timothy Baldwin

"Automatically Constructing a Normalisation Dictionary for Microblogs" EMNLP-CoNLL 2012

Phrase-level Normalization

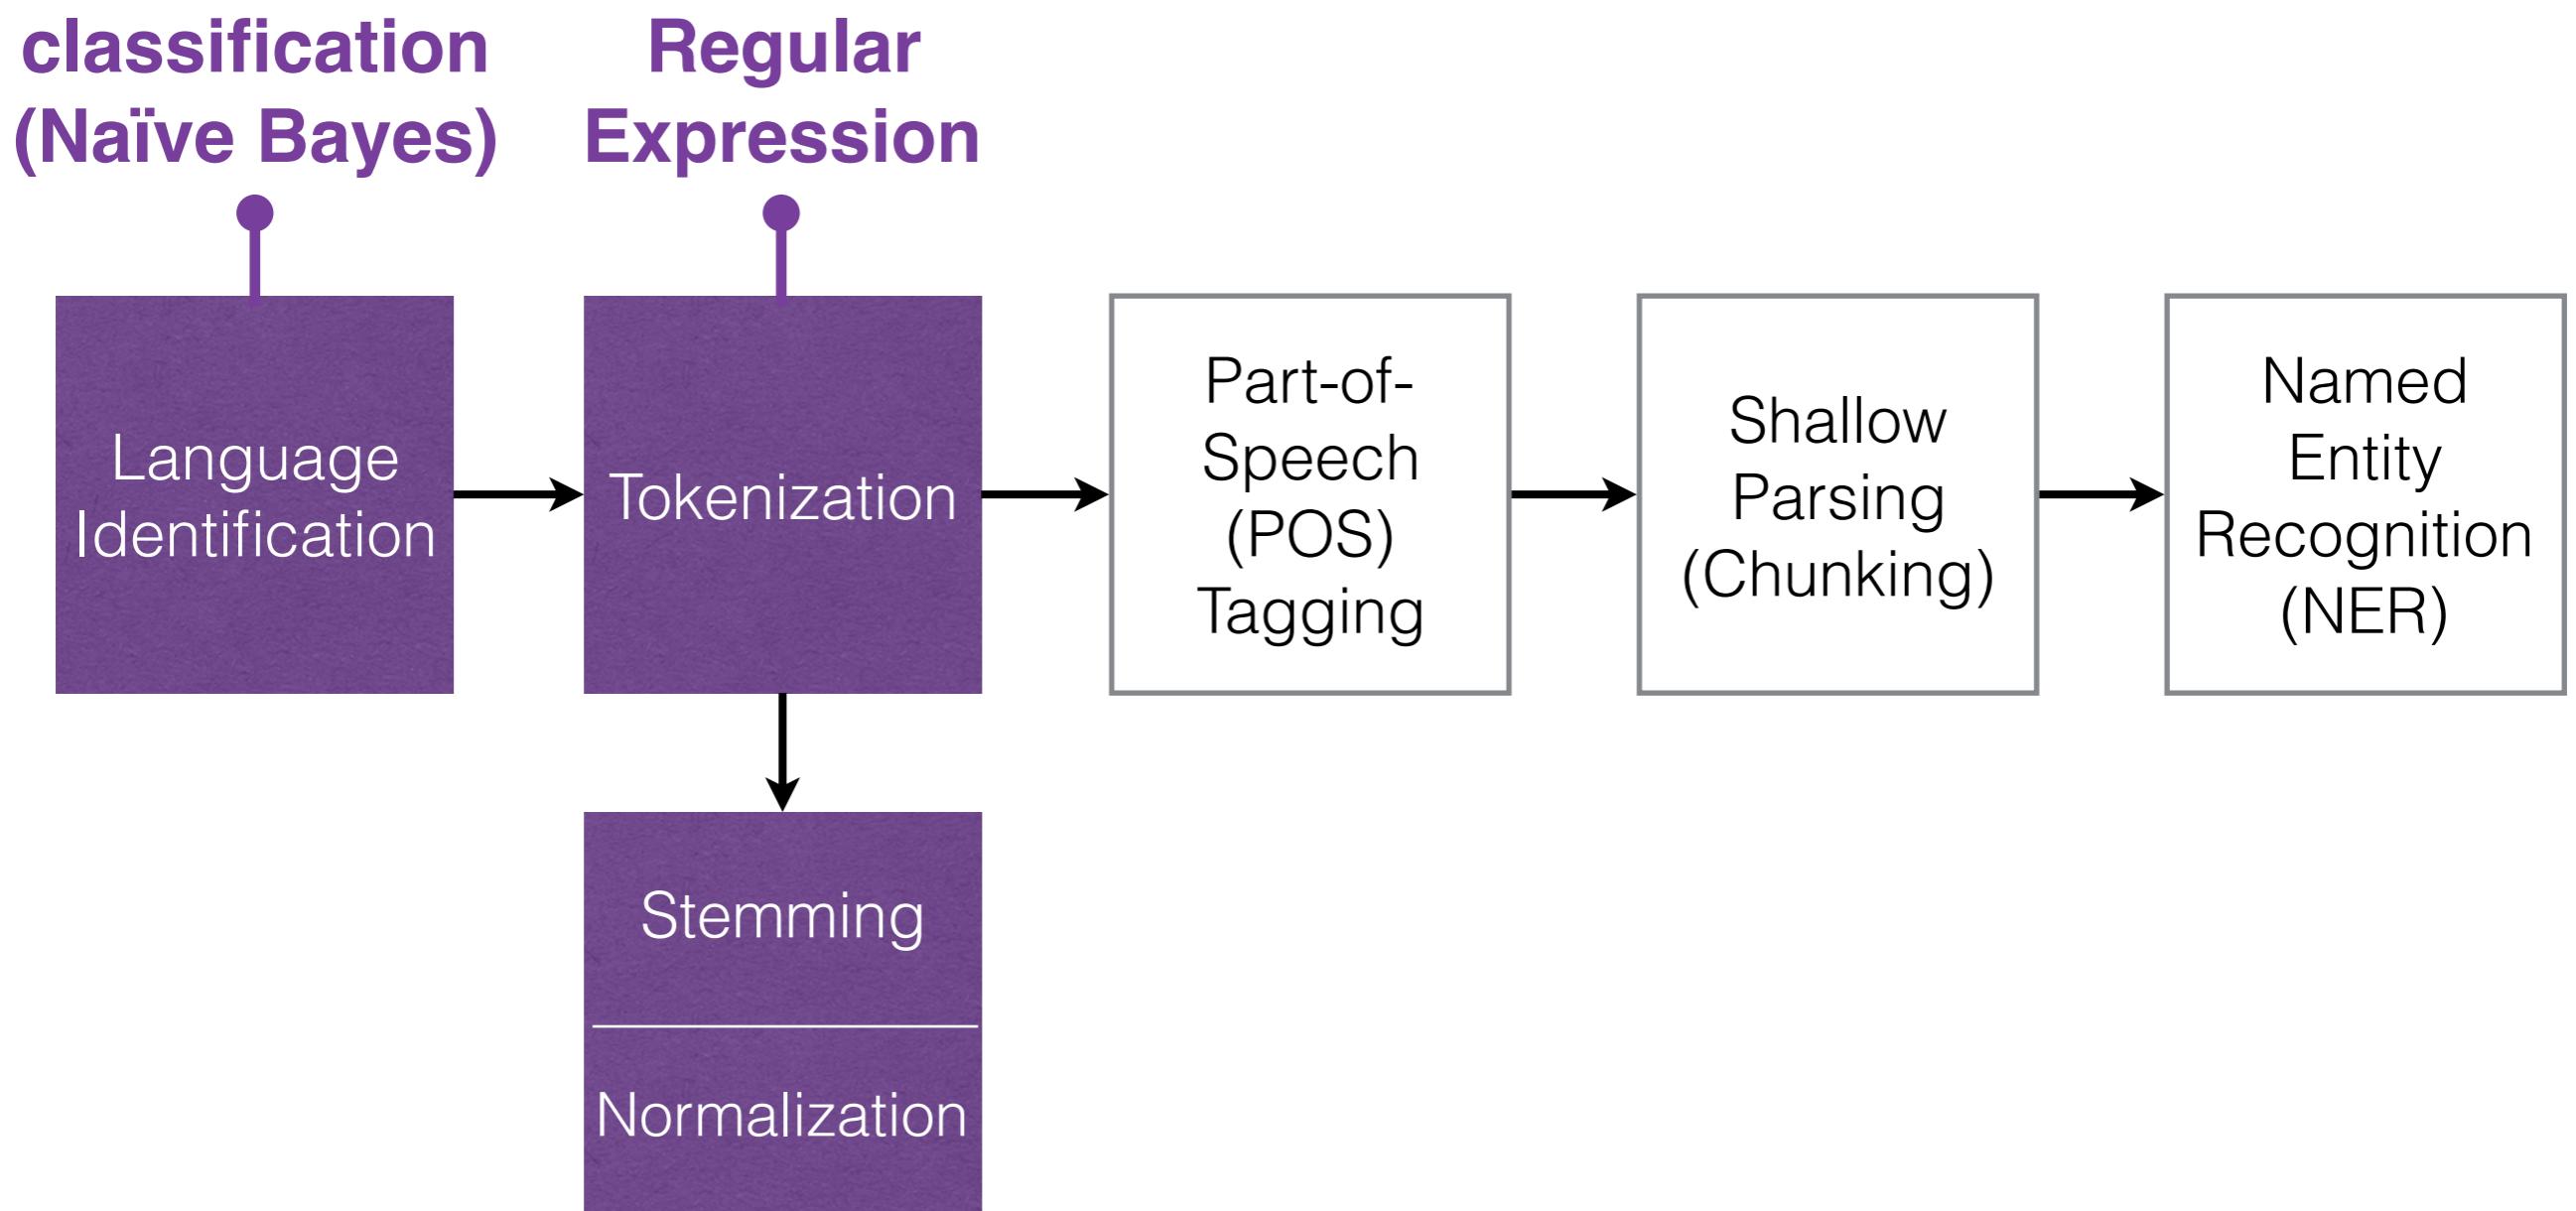

- word-level normalization is insufficient for many cases:

in-vocabulary words

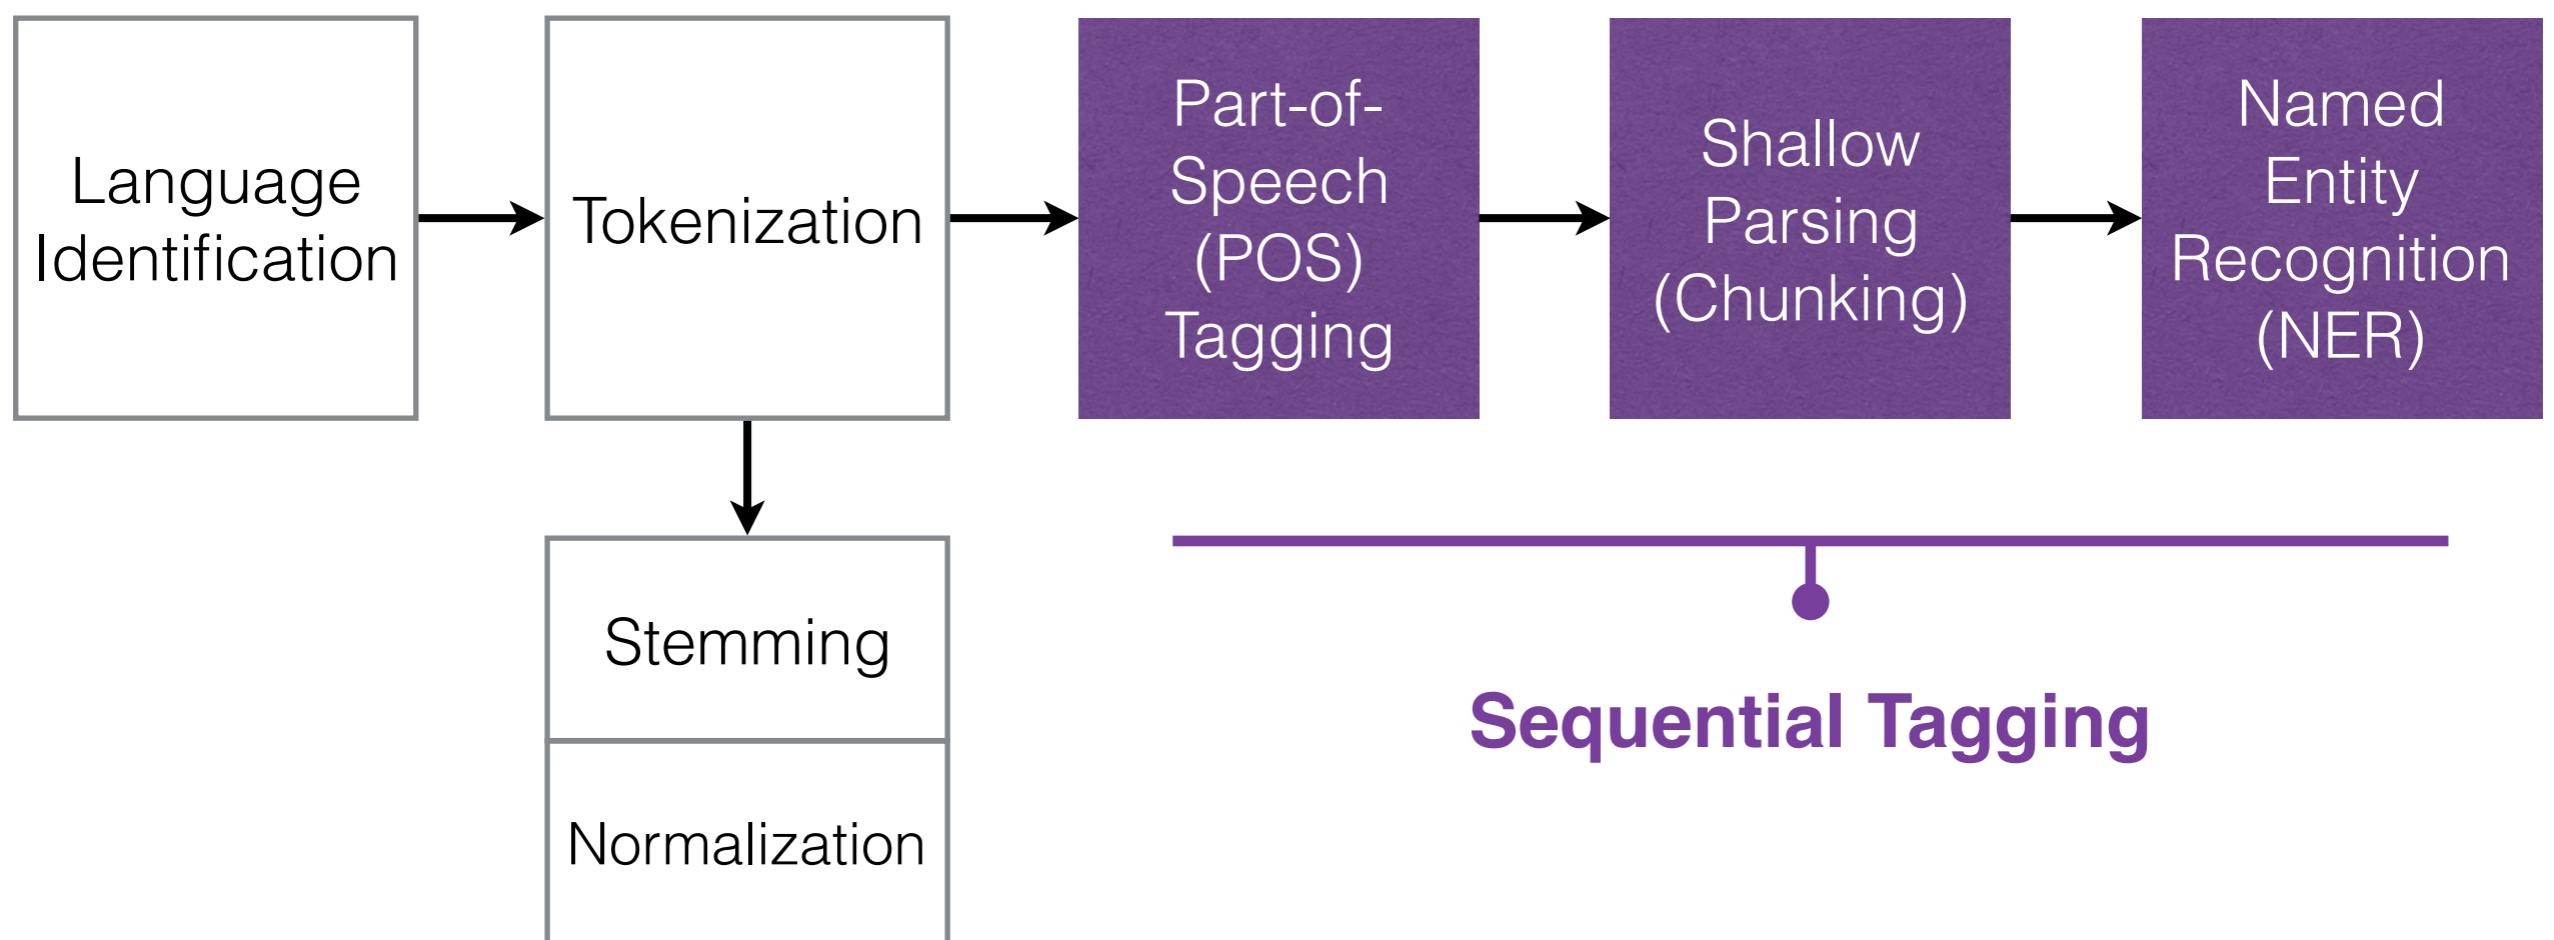

Category	Example
1-to-many	everytime → every time
incorrect IVs	can't want for → can't wait for
grammar	I'm going a movie → I'm going to a movie
ambiguities	4 → 4 / 4th / for / four

Source: Wei Xu, Alan Ritter, Ralph Grishman

Penn Treebank POS Tags

1. CC	Coordinating conjunction	25. TO	to
2. CD	Cardinal number	26. UH	Interjection
3. DT	Determiner	27. VB	Verb, base form
4. EX	Existential <i>there</i>	28. VBD	Verb, past tense
5. FW	Foreign word	29. VBG	Verb, gerund/present participle
6. IN	Preposition/subordinating conjunction	30. VBN	Verb, past participle
7. JJ	Adjective	31. VBP	Verb, non-3rd ps. sing. present
8. JJR	Adjective, comparative	32. VBZ	Verb, 3rd ps. sing. present
9. JJS	Adjective, superlative	33. WDT	<i>wh</i> -determiner
10. LS	List item marker	34. WP	<i>wh</i> -pronoun
11. MD	Modal	35. WP\$	Possessive <i>wh</i> -pronoun
12. NN	Noun, singular or mass	36. WRB	<i>wh</i> -adverb
13. NNS	Noun, plural	37. #	Pound sign
14. NNP	Proper noun, singular	38. \$	Dollar sign
15. NNPS	Proper noun, plural	39. .	Sentence-final punctuation
16. PDT	Predeterminer	40. ,	Comma
17. POS	Possessive ending	41. :	Colon, semi-colon
18. PRP	Personal pronoun	42. (Left bracket character
19. PP\$	Possessive pronoun	43.)	Right bracket character
20. RB	Adverb	44. "	Straight double quote
21. RBR	Adverb, comparative	45. '	Left open single quote
22. RBS	Adverb, superlative	46. "	Left open double quote
23. RP	Particle	47. '	Right close single quote
24. SYM	Symbol (mathematical or scientific)	48. "	Right close double quote

Part-of-Speech (POS) Tagging

- Words often have more than one POS:
 - The back door = JJ
 - On my back = NN
 - Win the voters back = RB
 - Promised to back the bill = VB
- POS tagging problem is to determine the POS tag for a particular instance of a word.

Chunking

Chunking

- recovering phrases constructed by the part-of-speech tags
- a.k.a shallow (partial) parsing:
 - full parsing is expensive, and is not very robust
 - partial parsing can be much faster, more robust, yet sufficient for many applications
 - useful as input (features) for named entity recognition or full parser
